

GOOGLE DRIVE API SETUP GUIDE

TARGET: Client / System Admin
USE CASE: Video Storage Automation

This guide outlines the step-by-step instructions required to authorize the backend server to automatically upload tournament match recordings directly to your designated Google Drive folder.

STEP 1: Create a Google Cloud Project & Enable Google Drive API

1. Open your browser and navigate to the **Google Cloud Console** (<https://console.cloud.google.com/>).
2. Sign in with your business Google / Google Workspace administrator account.
3. Click the **Project dropdown** in the top navigation bar and select **New Project**.
4. Enter a project name (e.g. **BlastX-Recordings**) and click **Create**.
5. Once creation completes, select the new project from the top dropdown to make it active.
6. Open the main navigation menu (top-left) and go to **APIs & Services > Library**.
7. Type **Google Drive API** into the search field, click on the result, and click the blue **ENABLE** button.

STEP 2: Create a Service Account & Download JSON Credentials

1. In the navigation menu, go to **APIs & Services > Credentials** (or **IAM & Admin > Service Accounts**).
2. Click **+ CREATE CREDENTIALS** at the top of the screen and choose **Service Account**.
3. Enter a name in the **Service account name** field (e.g. **gdrive-video-uploader**) and click **CREATE AND CONTINUE**.
4. The role assignment step is optional for Drive folder access - simply click **DONE**.
5. In the Service Accounts list, locate your newly created account and click its name to open details.
6. Select the **KEYS** tab located in the top tab bar.
7. Click **ADD KEY > Create new key**.
8. Select **JSON** as the key type and click **CREATE**.
9. A **.json** credentials file will immediately download to your computer. Store this file securely.

STEP 3: Create Target Folder in Google Drive & Grant Access

1. Open **Google Drive** (<https://drive.google.com/>) under the Google account where videos will be stored.
2. Create a new folder specifically for video uploads (e.g. **Match_Recordings**).
3. Double-click to open the folder and copy the **Folder ID** from your browser's address bar:
URL pattern: `https://drive.google.com/drive/folders/1a2B3c4D5e6F_EXAMPLE_FOLDER_ID`
4. Right-click on the folder name (or click the folder header dropdown) and select **Share**.
5. Open your downloaded **.json** file with any text editor (Notepad, VS Code) and copy the value of **client_email**.
Example: gdrive-video-uploader@blastx-recordings.iam.gserviceaccount.com
6. Paste this email address into the **Add people and groups** field in the Share modal.
7. Ensure the permission role is set to **Editor**, uncheck the **Notify people** checkbox (service accounts have no inbox), and click **Share**.

CHECKLIST: DELIVERABLES TO SEND TO THE DEVELOPER

Please provide the developer with only the following 2 items upon completing the setup:

- [] **1. Service Account JSON Key File:** The downloaded .json credentials file from Step 2.
- [] **2. Target Folder ID:** The alphanumeric string copied from your folder URL in Step 3.

IMPORTANT NOTICES: STORAGE QUOTA & SECURITY

- **Storage Capacity:** Video recordings consume substantial disk space. Standard personal @gmail.com accounts only include 15 GB of shared storage. It is strongly recommended to use a **Google Workspace** account or subscribe to a **Google One** storage plan for the destination Drive.
- **Credential Confidentiality:** The Service Account JSON file grants programmatic upload privileges. Transmit it via a private secure channel (e.g. encrypted zip or direct private message) and never commit it to public code repositories.
